Interesting History of the First Attempt to Supply the City With Water From the Mississippi River.

Enterprise Undertaken by the Commercial Bank of New Orleans, Chartered for That Purpose—How the Work Was Done.

By CHARLES PATTON DIMITRY.

The New Orleans public is too well acquainted with the completion of several important works that have been attempted, yet they naturally feel an interest in the history of those that they may not themselves have seen.

The New Orleans water problem is an old one. It was first attempted in 1839, but the project was shelved due to the objections of those who had hitherto been content with their own wells.

Among these enterprises are the attempts to bring a supply of water from the Mississippi River. The New Orleans sewerage system is in a bad state and the removal of the sewerage effluvia has been the subject of much discussion in the city.

The waterworks plan was designed to provide a reliable and adequate water supply for the city. It was to be a plant that would be self-sustaining and capable of meeting the demands of the growing population.

The project was, of course, a huge undertaking and required careful planning and execution. The New Orleans waterworks were to be built in three stages, with the first stage comprising the construction of a pumping station and the laying of water mains in the city.

The construction of the first stage was completed in 1860, and the city was able to draw water from the Mississippi River. However, the demand for water was so great that the system failed to meet the needs of the city.

The second stage of the project was completed in 1865, and the city was able to supply water to a larger area. The third and final stage was completed in 1870, and the city was able to supply water to all parts of the city.

The New Orleans waterworks were a great success and provided a reliable and adequate water supply for the city. The system was able to meet the demands of the growing population and helped to improve the health and welfare of the city.

In conclusion, the New Orleans waterworks were a huge undertaking that required careful planning and execution. The project was completed in three stages, with the first stage comprising the construction of a pumping station and the laying of water mains in the city.
