

WATER REPORT.

MAY 14, 1845.

R. H. THOMPSON, C. W. GODFREY AND WM. GILLESPIE,
Esq., Commissioners on Water.

According to a report contained in a Resolution of the Common Council, passed February 19th ult., I have made the necessary surveys and calculations to determine the expense of supplying the city of Albany with water from the Hudson river, and respectfully submit the following report—

Although the more elevated portions of the city of Albany have for years, severally met the want of a supply of water, not only for ordinary use, but even for the consumption of horses, and much has been said, and not a little written upon the subject, great diversity of opinion still exists, as to the most feasible and economical project to be adopted.

Several plans have been urged upon the attention of the Board three of which have been examined in report, hereto made to the Common Council.

On the 27th November 1841, Wm. Mc Cushman, C. E., reported the cost of supplying 1,165,000 imperial gallons per day from the Mohawk river, to a height of 200 feet above low tide \$191,540 79. And on January 3d 1842, he reported the cost of delivering the same amount from the Hudson river by steam power, to be \$260,152 92.

D. Douglass, C. E., in a report made March 15th, 1842 estimated the total investment to cover cost of delivering at present 2,000,000 imp. gals. from the Patroon's creek 170 feet above low tide with power to increase to 6,000,000 gallons \$241,592, and the total investment, to supply the same quantities in an equal height by steam power from the Hudson river, \$343,501, and the total investment to cover cost of supplying from the Mohawk that portion of the city lying below a plane 120 feet above low tide \$37,271.

In a report by S. F. Claxton, C. E., February 5th 1842, he estimates a supply of 2,000,000 imp. gals. per day from the Hudson delivered 120 feet above tide to cost \$37,271 and a supply of 5,000,000 gallons from the creek \$40,883 and of 7,000,000 gallons from the Mohawk river \$46,945.

Now it is by no means remarkable in the sense of careful estimate—that well-directed plan presented does not prevail, or that one definite action upon a subject of such paramount importance to the health and welfare of the citizens has not long since been taken.

A large portion of the inhabitants prefer the waters of the Hudson river either below the Mohawk, the best source of supply some maintain that the Patroon's creek above the Two Falls, is the only mountain whence to obtain so pure and pure water, and a few suppose the most economical plan to be that which shall depend upon the outlet of a small lake upon the Helderberg.

In the event of either of the first three being adopted, difficulties not usually encountered must be overcome. The location of Albany is peculiar and very unfavorable to every project yet examined for supplying it with water.

Occupying two plains, one upon the margin of the river and the other about 200 feet above it, with wide ravines intervening, a large portion of the supply must be furnished through the intervention of elevating power, and at a comparatively heavy expense.

If the Patroon's creek be selected, the price of its waters added to a sum required to raise a portion of it to the upper plane, makes the plan an expensive one, and if the Mohawk be taken, the cost of the conduit and of the power elevating machinery render necessary a large investment.

Nor are these pecuniary difficulties removed by depending upon the Hudson river as the source of supply—the great elevation to be overcome requires corresponding strength in the different parts of the work, and a heavy annual expense for the maintenance of the requisite motive power.

The plan and estimates herewith submitted are for supplying the city with water from the Hudson river and are predicated upon surveys and calculations for that object.

In a sub-section involving so large an expenditure, and one in which every citizen has a direct interest, it has been deemed no less economical than politic to make provision for constructing the several parts of the work in the most substantial manner. Great care has therefore been taken that the estimates shall warrant every outlay to insure durability and at the same time afford protection against accidents. There are certain elements materially affecting all estimates for supplying communities with water which require rigid examination. These are—

1. The quantity that may be required at a future period, &c.

2. The per diem allowance that should be provided for each inhabitant.

3. The quantity that may be required at a future period—in the construction of works in which so many and diversified interests are usually involved that dimensions should be sufficiently large to accommodate not only the present population but the future increase for a reasonable distant period. To effect machinery lay mains and contract reservoirs, the first part of the object in a few years is not less than to satisfy the wants of the people conveniently henceforth.

Under the most favorable circumstances it is extremely difficult to determine with exactness the population of a city at any future period, especially if its growth has been fluctuating in such a manner as to put it to such a quantity of water as will afford a abundant supply on the one hand, without needless waste and want of proportionality on the other.

From a report made March 12th 1842 by D. Douglass, C. E., it appears that the ratio of increase from 1790 to 1842 has been as follows—

From 1790 to 1800, an increase per annum of 1.04 per cent.

1790 to 1810, a rate more than 2%.

1810 to 1820, about 1%.

1820 to 1830, about 1%.

1830 to 1840, about 1%.

1840 to 1842, about 1%.

and the average of all these years is 1%.

Assuming 1% per annum as the base on which to estimate, he arrives at the following results—

In 1842, the population of Albany will be 40,000.

In 1852, 42,000.

In 1862, 44,000.

In 1872, 46,000.

In 1882, 48,000.

In 1892, 50,000.

In 1902, 52,000.

In 1912, 54,000.

In 1922, 56,000.

In 1932, 58,000.

In 1942, 60,000.

In 1952, 62,000.

In 1962, 64,000.

In 1972, 66,000.

In 1982, 68,000.

In 1992, 70,000.

In 1900, 72,000.

In 1910, 74,000.

In 1920, 76,000.

In 1930, 78,000.

In 1940, 80,000.

In 1950, 82,000.

In 1960, 84,000.

In 1970, 86,000.

In 1980, 88,000.

In 1990, 90,000.

In 2000, 92,000.

In 2010, 94,000.

In 2020, 96,000.

In 2030, 98,000.

In 2040, 100,000.

In 2050, 102,000.

In 2060, 104,000.

In 2070, 106,000.

In 2080, 108,000.

In 2090, 110,000.

In 2100, 112,000.

In 2110, 114,000.

In 2120, 116,000.

In 2130, 118,000.

In 2140, 120,000.

In 2150, 122,000.

In 2160, 124,000.

In 2170, 126,000.

In 2180, 128,000.

In 2190, 130,000.

In 2200, 132,000.

In 2210, 134,000.

In 2220, 136,000.

In 2230, 138,000.

In 2240, 140,000.

In 2250, 142,000.

In 2260, 144,000.

In 2270, 146,000.

In 2280, 148,000.

In 2290, 150,000.

In 2300, 152,000.

In 2310, 154,000.

In 2320, 156,000.

In 2330, 158,000.

In 2340, 160,000.

In 2350, 162,000.

In 2360, 164,000.

In 2370, 166,000.

In 2380, 168,000.
